ENG 102

Part One: Stakeholder / Audience Analysis

One of the most relevant audiences for my research at Arizona State University is students interested in seasonal work, outdoor recreation, or non-traditional career paths. This includes business students, like those in the W. P. Carey School of Business, as well as students involved in outdoor clubs or those looking for hands-on work experience. These students are stakeholders because they are potential newcomers to the mountain operations discourse community, even if they do not currently recognize it as a structured environment with specific communication practices.

A second key audience is first-year or exploratory students who are still deciding on career paths. Many of these students are exposed primarily to traditional internships, but fewer are aware of opportunities like ski instruction or ski patrol, which also require strong communication, adaptability, and teamwork. These students are stakeholders because they are actively seeking opportunities to build experience, and mountain operations offers a unique setting where communication skills are developed in real-time, high-pressure environments.

Both groups would benefit from learning how to enter and participate in this discourse community because the process is not always clear. Based on my research, communication—such as writing lesson notes, completing reports, and coordinating with others—is not formally taught but instead learned through participation and feedback. Without

understanding this, newcomers may struggle to integrate effectively. My research helps make these expectations visible, allowing students to approach the community more strategically. By understanding how communication functions within mountain operations, these audiences can better prepare for entry, perform more effectively, and apply these skills to other professional contexts.

Part Two: Genre Analysis (Website)

The audiences I have identified primarily consume information through digital platforms, especially websites that are easy to navigate and provide quick, actionable information. Because of this, a website is an effective genre for my DC Remix project. Websites are commonly used by students to explore opportunities, learn new processes, and access step-by-step guidance, making them a strong fit for teaching how to enter a discourse community.

A typical informational website includes a clear homepage, organized sections, and concise content broken into headings. Instead of long paragraphs, information is presented in shorter sections with bullet points, visuals, and clickable navigation. Users expect to quickly find answers to questions like “What is this?” and “How do I get started?” without needing to read large amounts of text.

The tone of this genre is informational and accessible, balancing credibility with clarity. Websites often avoid overly technical language and instead focus on usability and engagement. Evidence is presented in simplified forms, such as brief explanations, key takeaways, or highlighted insights, rather than extended analysis.
